What my problem was	What the AI agent gave me	What I used in my code
I had trouble with making tables and figures using matplotlib and pandas so I send the agent the first example where I wanted a table which was the report on the tokenizers. I send him the lines where I just printed a dict for each language and model with some strings but it didnt look clean enough.	tokenizers_table = {"char":(char_tokenizer,vocab_size_char,lambda sents: count_unk_char(sents)), "bpe_7000":(lambda s: bpe_7000.encode(s, out_type=str),vocab_size_S,lambda sents: count_unk_bpe(bpe_7000, sents)), "bpe_12000": (lambda s: bpe_12000.encode(s, out_type=str),vocab_size_L,lambda sents: count_unk_bpe(bpe_12000, sents))}	The agent helped me by giving me a joined dictionary for my data and how to use it for pandas. I used that dict as a template for many other plots because they all work pretty similarly and the rest about pandas plots like size, colors and type of plot I figured out with the pandas documentation and blog posts. In the same way the agent helped me with converting tables in to Latex format.
I struggled with implementing the BPC. I had the formula but I didnät know how to access the loss correctly.	for x, y in loader: x,y = x.to(device), y.to(device) logits = model(x) total_nats += sum_loss(logits.reshape(-1,logits.size(-1)),y.reshape(-1)).item() total_tokens += y.numel()	I used this part in my structure.
I used an agent to ceck my claims about Turkish and Chinese by giving it passages of my report.	The important part is Chinese. On the test data, the BPE models are slightly *better* than the character model in Chinese, not worse, so "Chinese performs best with the character model" and "BPE gets worse by 0.105-0.350" are no longer true. The gain for Chinese is just much smaller than for English and Turkish, and the 7,000 to 12,000 step is almost nothing. The whole Chinese paragraph and your checkpoint question need rewriting around that, and the English-Turkish gap (0.231 vs 0.209) is now small, so be careful with the morphology claim.	The agent helped to to differentiate better between what is my claim and what I can see in the data.
